

### Description for 500 Series Composite Table Top:

-Constructed of a special composite process and molded in a form that creates a seamless top and edge. No seams mean nowhere for moisture to collect and leach into the substrate, therefore no delamination ever. The seamless design also makes the tops extremely sanitary.

-The construction of the table has a honeycomb inner core that allows for the tabletops to remain lightweight, yet extremely strong.

-Tops are flat with smoothly rounded edges to prevent irritation of tender forearm skin. This edge shape allows tables to be abutted to form larger group areas and to allow tablecloths to lay flat.

-The bottom of the tabletop has an approximate 1" edge that can be gripped by the resident for convenience, positioning, and self-reliance.

-Integrated stud bolts are superior to standard mounting hardware allowing residents to put weight on the table as a means of assisting themselves to get up and also avoiding stripping out of the hardware.

-Use of strong detergents and other strong solutions will not harm the finish; even chlorine bleach causes no harm or residual odors.

- Using the ASTM E84 standard test. The flame spread of fiberglass is 125 with a smoke density of 395. According to the National Fire Protection Association this is a class C and according to the Uniform Building Code this is a class III.
